

FISCHER TECHNOLOGY

Fischer DataCenter Software for evaluating and archiving measurement data

Problem. Preparing, reading, and understanding your coating thickness measurement results can be difficult.

Solution. The FISCHER DataCenter Software significantly expands the functionality of FISCHER's measuring instruments. The measurement data can be transferred to a PC where inspection reports are created and printed, quickly and easily. This new software provides possibilities for immediate evaluation of your measurement results and a quick overview of the process. It displays a histogram, sum frequency chart, the statistical process control chart with just one click. With the optional version DataCenter IP, the measurement results and evaluations are linked to attributes, such as measurement location, name of operator, data and time. A report with your results, statistical evaluations and graphs according to your own specifications can be generated immediately with a click of the mouse.
