

## ELCOMETER

### An uncured powder thickness non-contact gauge to save the bottom line.

**Problem.** If you run a powder coating facility, how important is it for you to understand the financial numbers behind wasted time, wasted raw material, and wasted manpower, when applying too thick or too thin? And how crucial is it to also consider the cost of rework to make things right for your clients?

**Solution.** The Elcometer 550 is a state-of-the-art device, capable of measuring powder thickness at the precure stage, non-invasively. It is a hand-held device, with a color LCD screen. It performs better, faster, more reliably, and more accurately than other similar products out in the marketplace. The Elcometer 550 operates

within the range of 1.18 mils up to 4.4 mils. It is a masterfully engineered instrument, not a toy for children, but a dependable tool for dedicated professionals. This is the solution to an expensive and serious problem within the powder coating industry. Solve that problem and save your company's bottom line.
